

Fira Code SC

Fira Code for Latin + IBM Plex Sans SC for CJK, scaled so one CJK glyph advances **exactly two** Fira Code cells. Every line in the box below is 46 display columns wide (CJK counted as 2), so a correct font must render a perfectly flush right border.

1 — Naive fallback: Fira Code → IBM Plex Sans SC

```
+-----+
| Fira Code SC 等宽对齐演示          |
| 显示翻译 · 13小时 · 1,988 查看      |
| 时显查译 missing from JP fonts      |
| It's not x, it's ...                 |
| → ⇒ ≠ ≥ ligatures still work       |
+-----+
```

CJK falls back at its native width (≈ 1.67 Fira cells): the right border drifts on every line containing 中文.

2 — Fira Code SC (this project)

```
+-----+
| Fira Code SC 等宽对齐演示          |
| 显示翻译 · 13小时 · 1,988 查看      |
| 时显查译 missing from JP fonts      |
| It's not x, it's ...                 |
| → ⇒ ≠ ≥ ligatures still work       |
+-----+
```

CJK = exactly 2 cells: flush border, identical Latin glyphs, Fira Code ligatures (→, ⇒, ≠) intact — note line 6 renders them fused.

3 — Simplified-Chinese coverage

The chars 时 显 查 译 are simplified-only forms absent from Japanese fonts (JP has 時 顯 査 訳) — the gap that rules out Firple for SC text. Sample:

```
显示翻译:「时间就是金钱」 // translate & display
let 查询结果 = db.query("译文"); // 时显查译
```
